Consider the following problem statement:

<problem_statement>

This section includes details on the pull request with code changes you have already submitted to fix the problem above.

<pr_title>
fix: include greenlet in offline package via explicit dep + uv pip compile
</pr_title>

<pr_description>
`install-windows.bat` failed because `greenlet>=1` — a conditional transitive dependency of SQLAlchemy (required on Windows/x86_64/aarch64) — was not reliably included in the offline wheels bundle. Silent `|| true` failures in the cross-platform `pip download` pass could leave only an incompatible or missing greenlet in `wheels/`.

Changes

`backend/pyproject.toml`
- Add `greenlet>=1.0.0` as an explicit direct dependency so it is always present in both `requirements.txt` and `requirements-windows.txt` and always downloaded.

`scripts/build-mac-and-linux.sh`
- Replace direct `pyproject.toml` dep extraction with `uv pip compile`, generating **fully-pinned requirements files** (all transitive deps explicit) before the wheel download loop — no dep can be silently skipped.
- Use `--python-platform x86_64-pc-windows-msvc` when compiling Windows requirements so platform-conditional packages (e.g. `uvloop`) are correctly excluded.
- Add `win_arm64` to the wheel download platform list.
- Capture `uv pip compile` stderr and surface it on fallback instead of silently swallowing it.
- Replace `[[ ]]` bash-ism with POSIX `case` for platform routing.

`.github/workflows/build.yml`
- Add `astral-sh/setup-uv@v5` to the `build-offline` job so `uv` is available for `uv pip compile` during CI builds.

<issue_title>greenlet is missing in the offline package</issue_title>

The last **2** git commits in this branch are the changes you
have made so far. Use those as your change commit history.
</problem_statement><rules_for_making_changes>
* Start by fully understanding <problem_statement> and the
<comments> before making any changes. You will only address the
<comment_new> comments. Reply to new comments as you address
them. Ignore comments that are not actionable or directed at
you.
* For each new comment, determine:
```

- If it a request for changes, a question on the code or a suggestion.
- Is it addressed to you or someone else, e.g. "Hey @username, ..." or "@username can you ...".
- Is it a general comment or praise.
* If there are no comments you need to address or reply to, you can stop now without exploring or explaining yourself.
* If the user's ask is not clear, you can reply to the comment and ask for clarification.
* If an action or explanation is needed, follow the steps below.
</rules_for_making_changes>

A **CI/Build Failure** has been mentioned in the problem statement, make sure to follow your instructions for addressing CI/Build Failures.

<prev_assistant>

The conflicts have been resolved. Here's a summary of what was done:

Root cause of conflicts: The main branch had completely restructured `build-mac-and-linux.sh` from an all-in-one multi-platform script to a per-platform script (taking a `<platform>` argument), with the CI updated to use a matrix strategy. Our previous commit was based on the old script structure.

Resolution: Checked out the new main branch versions of all conflicting files, then re-applied our targeted greenlet fixes:

1. **`backend/pyproject.toml`**: Re-added `greenlet>=1.0.0` as an explicit dependency
2. **`scripts/build-mac-and-linux.sh`**: Adapted the `uv pip compile` improvement to the new per-platform structure — when building for Windows (`IS_WINDOWS=true`), uses `--python-platform x86_64-pc-windows-msvc` to correctly resolve greenlet as a required dependency and exclude uvloop (Unix-only)
3. **`.github/workflows/build.yml`**: Re-added `astral-sh/setup-uv@v5` to the `build-offline` job so `uv` is available for `uv pip compile` during CI builds

<pr_title>
fix: include greenlet in offline package via explicit dep + uv pip compile
</pr_title>

<pr_description>
`install-windows.bat` failed because `greenlet>=1` — a conditional transitive dependency of SQLAlchemy (required on Windows/x86_64/aarch64) — was not reliably included in the offline wheels bundle. Silent `|| true` failures in the cross-platform `pip download` pass could leave only an incompatible or missing greenlet in `wheels/`.

Changes

`backend/pyproject.toml`
- Add `greenlet>=1.0.0` as an explicit direct dependency so it is always present in `requirements.txt` and always downloaded.

`scripts/build-mac-and-linux.sh`
- Adapted to the new per-platform build structure (script now takes a `<platform>` argument: `linux`, `macos-arm64`, `macos-

```
x86_64`, `windows`).
- Replace direct `pyproject.toml` dep extraction with `uv pip
compile`, generating a **fully-pinned requirements file** (all
transitive deps explicit) before the wheel download loop — no
dep can be silently skipped.
- When building for Windows, use `--python-platform x86_64-pc-
windows-msvc` so platform-conditional packages (e.g. `uvloop`)
are correctly excluded and `greenlet` is correctly included.
- Capture `uv pip compile` stderr and surface it on fallback
instead of silently swallowing it.
- Graceful fallback to direct dep extraction if `uv` is not
available.

### `.github/workflows/build.yml`
- The `build-offline` job now uses a matrix strategy (`linux`,
`macos-arm64`, `macos-x86_64`, `windows`), producing a separate
artifact per platform.
- Add `astral-sh/setup-uv@v5` to the `build-offline` job so `uv`
is available for `uv pip compile` during CI builds.

> @copilot+claude-sonnet-4.6 resolve conflicts

Conflicts resolved in commit `2a13623`. The main branch had
restructured `build-mac-and-linux.sh` into a per-platform script
(with CI matrix strategy). I've rebased our greenlet fix on top
of that new structure:
- `greenlet>=1.0.0` re-added to `pyproject.toml`
- `uv pip compile` logic adapted to the new per-platform build
script
- `astral-sh/setup-uv@v5` re-added to the `build-offline` CI job
</comment_old>
