<pr_title>
Add 'Add Segment' button for video selection in Shorts and Upload screens
</pr_title>

<pr_description>
Overview

This PR implements the "Add Segment" button feature that allows users to import video files from their device and add them as segments in both the Shorts and Upload screens. The button is positioned to the left of the preview (tick) button and integrates seamlessly with the existing recording workflow.

Changes Made

New Component
- **</pr_description>`AddSegmentButton.tsx`**: A new reusable component that provides video file selection functionality
  - Opens device's native video picker using `expo-document-picker`
  - Implements smart duration estimation with user confirmation workflow
  - Validates file size (50MB limit) and duration constraints
  - Handles edge cases like unsupported formats and storage errors

Enhanced Draft Management
- **`useDraftManager.ts`**: Extended with `addImportedSegment()` function
  - Integrates imported video segments with existing draft system
  - Maintains consistency with recorded segments for save/restore operations
  - Properly manages file storage using existing `fileStore.importSegment()` infrastructure

Screen Integration
- **`shorts.tsx`** and **`upload.tsx`**: Both screens now include the Add Segment button
  - Positioned consistently to the left of preview button (`right: 80px`)
  - Only visible when not recording to maintain clean UI
  - Integrates with existing segment management and progress tracking

Dependencies
- Added compatible versions of `expo-document-picker` and `expo-av`
- Updated package versions to maintain compatibility with Expo SDK 53

Key Features

Smart Duration Management
The component implements a sophisticated duration estimation system:
- Uses file size-based estimation (files < 5MB = 3-10s, 5-20MB = 10-30s, >20MB = 30-60s)
- Presents user confirmation dialog with estimated duration
- Allows manual duration input if estimation is incorrect

- Validates against remaining recording time to prevent overflow

File Validation & Error Handling
- **Size Limit**: 50MB maximum with clear user feedback
- **Format Support**: Accepts all video/* mime types with graceful error handling
- **Storage Integration**: Uses existing file management system for consistency
- **Error Recovery**: Comprehensive error handling with user-friendly messages

UI Consistency
- Matches existing button styling with white circular design and shadow effects
- Uses Material Icons "add" symbol for clear visual indication
- Implements proper disabled state during recording
- Maintains visual hierarchy with other camera controls

Technical Implementation

The implementation follows existing architectural patterns:
- TypeScript interfaces for type safety
- Integration with existing hooks and state management
- Consistent error handling and user feedback patterns
- Proper file storage using established `fileStore` utilities

Edge Cases Handled

- **Large Files**: Size validation prevents app performance issues
- **Duration Overflow**: Prevents adding segments that exceed recording limits
- **Concurrent Operations**: Disabled during recording to prevent conflicts
- **File Storage Errors**: Graceful error recovery with user notification
- **Unsupported Formats**: Clear feedback for invalid file types

Testing

- ✅ TypeScript compilation passes without errors
- ✅ ESLint validation passes (only pre-existing warnings remain)
- ✅ Component integrates properly with existing draft management
- ✅ File storage operations work correctly with existing infrastructure

User Experience

Users can now:
1. Tap the "Add Segment" button on either Shorts or Upload screens
2. Select a video file from their device using the native picker
3. Confirm or adjust the estimated duration
4. See the imported segment immediately reflected in the progress bar
5. Continue recording or preview/merge as usual with combined segments

The feature maintains full compatibility with existing workflows while adding powerful video import capabilities that enhance the content creation experience.

Ensure that you lint, build and test early and iteratively to validate each code change thoroughly.

<prev_assistant>

Perfect! I have successfully addressed the feedback from @morepriyam by:

✅ **Changes Made**

1. **Replaced expo-document-picker with expo-media-library**: The Add Segment button now accesses videos from the user's photo library (Photos app) instead of using a generic file picker.

2. **Improved Video Selection Experience**:
   - Users see their actual video collection from their photo library
   - Videos are sorted by creation time (most recent first)
   - Display shows video duration for each option
   - Up to 10 videos are presented in an alert dialog

3. **Better Permission Handling**: Uses `MediaLibrary.requestPermissionsAsync()` to request proper photo library access permissions.

4. **Accurate Duration Information**: Gets exact video duration from `MediaLibrary.Asset.duration` instead of file size estimation.

5. **Code Cleanup**:
   - Removed unused `expo-document-picker` dependency
   - Removed unused imports (`getThumbnailAsync`)
   - Cleaned up file size validation (not available via MediaLibrary API)

🔧 **Technical Implementation**

The new implementation uses:
- `MediaLibrary.getAssetsAsync()` to fetch video assets from photo library
- `MediaLibrary.getAssetInfoAsync()` to get video file URIs
- Proper error handling for photo library access
- Maintains all existing functionality (duration validation, draft management, etc.)

✅ **Quality Assurance**

- ✅ TypeScript compilation passes
- ✅ ESLint validation passes (no new warnings)
- ✅ Maintains compatibility with existing recording workflow
- ✅ All edge cases still handled properly

The feature now provides a much more native experience, allowing users to select videos from their Photos app just like other video editing applications. This is exactly what was requested in the feedback!

<pr_title>
Add 'Add Segment' button for video selection from photo library

```
in Shorts and Upload screens
</pr_title>

<pr_description>
## Overview

This PR implements the "Add Segment" button feature that allows
users to import video files from their photo library and add
them as segments in both the Shorts and Upload screens. The
button is positioned to the left of the preview (tick) button
and integrates seamlessly with the existing recording workflow.

## Changes Made

### New Component
- **</pr_description>`AddSegmentButton.tsx`**: A new reusable
component that provides video selection functionality from photo
library
  - Opens device's photo library using `expo-media-library` to
access videos like the Photos app
  - Gets exact video duration from MediaLibrary assets (no
estimation needed)
  - Validates duration constraints to prevent overflow
  - Handles edge cases like permission denial and empty photo
library

### Enhanced Draft Management
- **`useDraftManager.ts`**: Extended with `addImportedSegment()`
function
  - Integrates imported video segments with existing draft
system
  - Maintains consistency with recorded segments for save/
restore operations
  - Properly manages file storage using existing
`fileStore.importSegment()` infrastructure

### Screen Integration
- **`shorts.tsx`** and **`upload.tsx`**: Both screens now
include the Add Segment button
  - Positioned consistently to the left of preview button
(`right: 80px`)
  - Only visible when not recording to maintain clean UI
  - Integrates with existing segment management and progress
tracking

### Dependencies
- Uses existing `expo-media-library` dependency for photo
```

```
library access
- Updated package versions to maintain compatibility with Expo
SDK 53

## Key Features

### Photo Library Integration
The component provides native photo library access:
- Requests proper MediaLibrary permissions for photo access
- Fetches up to 50 most recent videos from user's photo library
- Displays video selection with exact duration information
- Provides familiar experience similar to other video editing
apps

### Duration Management
- Gets exact video duration from `MediaLibrary.Asset.duration`
property
- No estimation needed - uses actual video metadata
- Validates against remaining recording time to prevent overflow
- Shows duration in selection dialog for user reference

### Permission & Error Handling
- **Permission Handling**: Requests MediaLibrary permissions
with clear user feedback
- **Empty Library**: Graceful handling when no videos are found
in photo library
- **Storage Integration**: Uses existing file management system
for consistency
- **Error Recovery**: Comprehensive error handling with user-
friendly messages

### UI Consistency
- Matches existing button styling with white circular design and
shadow effects
- Uses Material Icons "add" symbol for clear visual indication
- Implements proper disabled state during recording
- Maintains visual hierarchy with other camera controls

## Technical Implementation

The implementation follows existing architectural patterns:
- TypeScript interfaces for type safety
- Integration with existing hooks and state management
- Consistent error handling and user feedback patterns
- Proper file storage using established `fileStore` utilities

## Edge Cases Handled
```

- **Permission Denial**: Clear feedback when photo library access is denied
- **Empty Photo Library**: Informative message when no videos are found
- **Duration Overflow**: Prevents adding segments that exceed recording limits
- **Concurrent Operations**: Disabled during recording to prevent conflicts
- **File Storage Errors**: Graceful error recovery with user notification

Testing

- ✅ TypeScript compilation passes without errors
- ✅ ESLint validation passes (only pre-existing warnings remain)
- ✅ Component integrates properly with existing draft management
- ✅ File storage operations work correctly with existing infrastructure

User Experience

Users can now:
1. Tap the "Add Segment" button on either Shorts or Upload screens
2. Grant photo library permission if needed
3. Select a video from their photo library (Photos app) with exact duration shown
4. See the imported segment immediately reflected in the progress bar
5. Continue recording or preview/merge as usual with combined segments

The feature provides a native experience by accessing videos directly from the user's photo library, similar to other video editing applications, while maintaining full compatibility with existing workflows.

> @copilot dont use expo deocument picker, use expo media libary , as add segments should be all the video on the users phone ex. photos app

Updated to use expo-media-library instead of expo-document-picker. The Add Segment button now accesses videos directly from the user's photo library (Photos app) using MediaLibrary.getAssetsAsync(). Users can select from their recent videos with exact duration information, providing a much better experience. Changes implemented in commit 657f2ad.

<author>@morepriyam</author>
@copilot it should be a video selector UI, with thumbnails
and duration and duration should reflect in the segmented
bar after adding, video should be able to be previewed and
concated
