<request>

You are working on a task in the 'BlackbirdWorks/gopherstack' repository.

<repository_context>
I've cloned the repository in the directory /home/runner/work/gopherstack/gopherstack (not in /tmp/inputs). Always use absolute paths when referring to files in the repository.
</repository_context>

<current_datetime>2026-04-22T01:09:10.637+00:00</current_datetime>

Consider the following problem statement:

<problem_statement>
(refinement check 2 of 3 against issue #1101). Please review your implementation against all requirements in the original issue and refine anything that is missing or incomplete. While refining look for any missing features compared to localstack and aws realism. Find any performance issue or optimizations along with any issues with concurrency. Ensure there is no resource leaks or go routine leaks. Find at least 20 additional items in each refinement both UI or API. commit and push after every edit. if 403 happens there is a repo secret called GH_TOKEN you can use to push. Please address any review feedback.
</problem_statement>

First, determine whether the <problem_statement> requires code changes, an explanation, a plan, or analysis. Then follow the appropriate path:

If the task requires code changes:

**If the task is a question or only requires creating a plan or

analysis:** respond directly without making code changes.

<prev_assistant>

Refinement Check 2 — Complete

All 25+ items implemented, linted, and tested across 3 commits:

Backend (8 new operations + pagination):
- `UpdateRestApi`, `UpdateDeployment`, `UpdateResource` — PATCH support for core resources
- `GetAccount` — returns realistic throttle limits (burst 5000, rate 10000)
- `GetTags` / `TagResource` / `UntagResource` — full tag CRUD at `/tags/{arn}`
- `TestInvokeMethod` — POST on method path, returns 200 for MOCK integrations
- Stage `invokeUrl` field — computed as `/proxy/{apiId}/{stageName}` in all GetStage responses
- `GetAPIKeysPage`, `GetDomainNamesPage`, `GetUsagePlansPage` — cursor pagination with reusable `paginatePage[T any]` generic helper
- Query string params now forwarded into action body (fixes `limit`/`position` for all list ops)

UI (complete rewrite — 6 tabs, 15 tests):
- REST APIs tab: create/delete, endpoint type selection, API detail panel with 5 sub-tabs (Resources, Stages, Deployments, Authorizers, Models), Deploy button
- API Keys tab: create/delete, enable/disable toggle, value copy button
- Usage Plans tab: create/delete, associated keys sub-panel
- Domain Names tab: create/delete with endpoint type
- Metrics tab: live counts for all resource types + supported operation tags
- Docs tab: all 73 operations grouped by category
- Demo Data button: seeds a petstore API with stages, key, plan, and domain
- Resource tree: hierarchical depth-indented view with method badges
