Consider the following problem statement:

<problem_statement>

This section details on the original issue you should resolve

<issue_title>[Enh]: Implement role inheritance for entity permissions</issue_title>
<issue_description>## Problem

Today, a developer is required to repeat permissions across all possible roles.

> Today's lack of permissions inheritance can lead to very verbose configs and unexpected denials.

Desired Behavior

Introduce role inheritance that let's unlisted roles inherit from roles with fewer permissions.

`Specific-role -(not found)-> Authenticated -(not found)-> Anonymous -(not found)-> None`

```
### Rules

1. When any role is configured in `permissions`, that role
always gets its that configuration.
2. When `authenticated` is not configured, `authenticated`
inherits the permissions of `anonymous`, if present.
3. When `named-role` is not configured, it inherits the
permissions of `authenticated`, if present.
4. When `named-role` is not configured and neither is
`authenticated`, it inherits the permissions of `anonymous`, if
present.
5. When `named-role` is not configured and neither is
`authenticated` or `anonymous`, it inherits nothing.
6. Permissions inheritance includes `actions, `policies` and
`fields`.
7. It is still Data API builder's permission model that the
requestor is only ONE role at a time.

## Command line

We need to ensure the developer always has a way to know and
understand inheritance.

`dab configure --show-effective-permissions </issue_description>

<agent_instructions>Introduce as little code as possible.</
