*This section details on the original issue you should resolve*

<issue_title>Fix Linux Issues With Tests</issue_title>
<issue_description>The linux runners that the GitHub coding agents use are somewhat incompatible with the Recursive Extractor test suite. For at least the following reasons - based on previous agent executions:

1. The runners appear to be case sensitive, but some test cases use case insensitive file names for the test data archives - the file names should be corrected to be case sensitive so the tests work on case sensitive file systems
2. The runners apear to fail to execute .wim format tests - this format is only supported on windows and should just be skipped on non windows platforms
3. Potential issue in `SanitizePathLinux` colon handling

The agent shoudl execute the tests, iterate through fixing these problems, identify if there are other issues to be resolved as

well, and attempt to get a clean pass across the entire test suite - with the caveat that since it is a linux runner it will not be able to run the net48 version of the tests, so its fine to focus on net10.0 during execution.</issue_description>
