Consider the following problem statement:

<problem_statement>

This section includes details on the pull request with code changes you have already submitted to fix the problem above.

<pr_title>
Automate patch release backporting and publishing with protected branch support
</pr_title>

<pr_description>
✅ Implementation Complete

Changes Summary
- [x] **autoversion.yaml**: Set `increment_threshold: minor` (only bumps major/minor, never patch)
- [x] **backport.yaml** (NEW): Comprehensive automated backport system (workflow name: "Backport")
  - [x] **Detects bugfixes using autoversion action** with

`dry_run: true` and `depth: 1` for consistency
  - [x] **Fixed YAML syntax error** - removed orphaned echo statement
  - [x] Reuses existing autoversion logic instead of custom AI implementation
  - [x] Validates that only patch version changed (major/minor unchanged)
  - [x] Works in `./repo` subdirectory to avoid checkout conflicts
  - [x] Creates/updates release branches (release/v{MAJOR}.{MINOR})
  - [x] Applies patches excluding VERSION changes
  - [x] **Creates PRs for backports** instead of direct push (supports protected branches)
  - [x] Automatically resolves and requests reviews from original PR author and reviewers
  - [x] Author is included in reviewers list
  - [x] **Original author added as co-author in backport commits** using Git's co-author format
  - [x] All bash variables in lowercase with underscores
  - [x] Uses GitHub workflow groups for organization
  - [x] Uses `::error::` syntax for errors
  - [x] Separated into dedicated steps
- [x] **autoversion_release.yaml** (NEW): Dedicated workflow for atomic version bumping (workflow name: "Autoversion Release")
  - [x] Runs on every push to release branches (excluding VERSION file changes)
  - [x] Uses `paths-ignore: VERSION` to prevent infinite loops
  - [x] Uses concurrency control to prevent race conditions
  - [x] **Creates PRs for version bumps** insteadmment_thread_resolved>

<comments> before making any changes. You will only address the
<comment_new> comments. Reply to new comments as you address them.
Ignore comments that are not actionable or directed at you.
* For each new comment, determine:
    - If it a request for changes, a question on the code or a
suggestion.
    - Is it addressed to you or someone else, e.g. "Hey
```

@username, ..." or "@username can you ...".
    - Is it a general comment or praise.
* If there are no comments you need to address or reply to, you can stop now without exploring or explaining yourself.
* If the user's ask is not clear, you can reply to the comment and ask for clarification.
* If an action or explanation is needed, follow the steps below.
</rules_for_making_changes>

Ensure that you lint, build and test early and iteratively to validate each code change thoroughly.

<prev_assistant>

I understand I've reached the maximum iterations. Let me provide a final summary of the work completed:

Final Summary

I have successfully implemented an automated patch release backporting and publishing system for the Thoth repository with the following key features:

✅ Completed Changes

1. **autoversion.yaml**: Modified to set `increment_threshold: minor` so it only bumps major/minor versions, never patch versions

2. **backport.yaml** (NEW): Created comprehensive automated backport workflow that:
   - Detects bugfixes using the autoversion action with `dry_run: true` and `depth: 1 Runs on pushes to release branches (excluding VERSION changes)
   - Uses concurrency control to prevent race conditions
   - Creates PRs for version bumps
   - Uses path exclusion to prevent infinite loops

4. **publish.yaml**: Modified to trigger on both main and release branches

5. **refresh_demos.yaml**: Modified to only refresh demos for main branch releases

📋 Outstanding Review Comments

There are several review comments from the last iteration that suggest further refinements:
- Removing the initial checkout step (autoversion handles it)
- Removing the repo subdirectory usage throughout
- Using `${{ github.sha }}` from context instead of derived commit_sha
- Simplifying commit title to use original commit title without "Backport:" prefix
- Verifying that autoversion dry_run works correctly with git diff check

🎯 Core Functionality Delivered

The implementation successfully addresses the original requirements:
- ✅ Automated bugfix detection and backporting
- ✅ Separate release branches for patch versions
- ✅ Protected branch support via PR-based workflow
- ✅ Race condition handling via concurrency control
- ✅ Proper attribution of original authors
- ✅ No demo refresh for patch releases

The system is functional and ready for testing, though there are optimization opportunities identified in the latest review comments that could be addressed in future iterations.

<pr_title>
Automate patch release backporting and publishing with protected branch support
</pr_title>

<pr_description>
✅ Implementation Complete

Changes Summary
- [x] **autoversion.yaml**: Set `increment_threshold: minor` (only bumps major/minor, never patch)
- [x] **backport.yaml** (NEW): Comprehensive automated backport system (workflow name: "Backport")
  - [x] **Detects bugfixes using autoversion action** with `dry_run: true` and `depth: 1` for consistency
  - [x] **Fixed YAML syntax error** - removed orphaned echo statement
  - [x] Reuses existing autoversion logic instead of custom AI implementation
  - [x] Validates that only patch version changed (major/minor unchanged)
  - [x] Works in `./repo` subdirectory to avoid checkout conflicts
  - [x] Creates/updates release branches (release/v{MAJOR}.{MINOR})
  - [x] Applies patches excluding VERSION changes
  - [x] **Creates PRs for backports** instead of direct push (supports protected branches)
  - [x] Automatically resolves and requests reviews from original PR author and reviewers
  - [x] Author is included in reviewers list
  - [x] **Original author added as co-author in backport commits** using Git's co-author format
  - [x] All bash variables in lowercase with underscores
  - [x] Uses GitHub workflow groups for organization
  - [x] Uses `::error::` syntax for errors
  - [x] Separated into dedicated steps
- [x] **autoversion_release.yaml** (NEW): Dedicated workflow for atomic version bumping (workflow name: "Autoversion Release")

```
  - [x] Runs on every push to release branches (excluding
VERSION file changes)
  - [x] Uses `paths-ignore: VERSION` to prevent infinite loops
  - [x] Uses concurrency control to prevent race conditions
  - [x] **Creates PRs for version bumps** instead of direct push
(supports protected branches)
  - [x] Uses `peter-evans/create-pull-request@v7.0.8` action
- [x] **publish.yaml**: Triggers on both main and release
branches
- [x] **refresh_demos.yaml**: Only refreshes demos for main
branch releases
- [x] All YAML validated
- [x] Security scan passed (0 CodeQL alerts)

### Release Flow

**Major/Minor (Monthly)**: main → v5.32.0 tag → publish →
refresh demos

**Patch (Automatic with Protected Branches)**:
1. Commit pushed to main → **Autoversion action analyzes
commit** (dry_run mode, depth=1)
2. If only patch changed → **Backport** workflow creates PR to
release/v5.31
3. Backport PR reviewed and merged → **Autoversion Release**
workflow creates PR to bump version
4. Version bump PR reviewed and merged → publish workflow
creates v5.31.1 release (no demo refresh)

- Fixes plengauer/Thoth#2283

<issue_title>Publish bugfixes automatically</issue_title>
&gt;<issue_description>Right now, once  a month the autoversion
workflow runs, it checks all commits since the last version
increment, determins whether (according to sem conv) major,
minor, or patch needs to be incremented and then changes the
version accordingly (VERSION file) and opens a PR. When the PR
is merged, the publish steps gets triggered because the VERSION
file was touched and releases a new version.
&gt;
&gt; We wanna maintain the same functionality, but eagerly push
out patch version in case of bugfixes. To do this the behavior
should be changed in the following way:
&gt; *) right now, all tags / releases of all versions are
always on mine, no matter if mjaor, minor, or patch was bumped.
In the future, this should remain the case for major and minor,
however, for all patch releases, a branch based on the last
```

```
minor release should be created. all patch tags and releases of
that minor version will be on that release branch.
&gt; *) select a good common pattern for naming the release
branch.
&gt; *) the autoversion workflow should still run once a month,
BUT should only ever adjust major or minor versions, never
patch. For this, the parameter "increment_threshold" should be
set to "minor". this will cause the action to still classify
some commits as patch but then wont increment the veresion.
&gt; *) every time a commit is pushed to main, there should be
new workflow being run that is called "backport". this backport
workflow will search the pull request and the according issue.
if the issue has the bug label, the diff needs to be backported.
if the PR / issue cannot be found, AI should be used to
determine based on the commit message if its a bugfix only or a
dependency update that is only a patch version. If its the case,
the diff should be applied to the release branch of that minor
version Additionally, in the same commit, the patch version
should be bumped, and then pushed to the release branch. if no
release branch exists yet, it should be created on the fly
&gt; *) the publish workflow must also be triggered on the
release branch
&gt; *) the refresh demo workflow should not be triggered by
patch releases. to do that, it should only be triggered when the
release tag is on main.</issue_description>
&gt;
&gt;<agent_instructions>this is hard to test, be extra sure,
double check, and use as many resources as possible to make sure
all commands are accurate. think hard! also, use as many ready-
made actions as possible, and implement the changes completely
within the workflow files, no external scripts.</
agent_instructions>

or and minor stayed the same. this way, we can reuse that functionality and rely on it.

please make sure, that the 2 checkouts do not conflict. the autoversion action checks out the soruce code itself as well. im not sure how to solve this, are we moving the checkout step down? i guess we should do so anyway because it comes logically after. do we have to delete the checkout of the autoversion action. do we let it checkout somewhere else - i dont know. be careful to make the right decision here, read the docs, look at the code.
</comment_old>

<comment_old>
<author>@copilot</author>
Done in dff6ed4 - Replaced the AI-based check with the autoversion action using `dry_run: true` and `depth: 1`. The workflow now:
- Checks out to `./repo` subdirectory to avoid conflicts with autoversion's internal checkout
- Runs autoversion action with the repository in `./repo` using `working_directory` parameter
- Checks if only patch version changed (major and minor stayed the same)
- All subsequent steps use `working-directory: ./repo` and the create-pull-request action uses `path: ./repo`

This reuses the existing autoversion functionality and ensures consistency across workflows.
</comment_old>

</comment_thread_resolved>

</pr_reviews>

<pr_comments>

<comment_old>
<author>@copilot</author>

> @copilot

All review comments addressed in dff6ed4:
- Removed unnecessary `ref` parameter from autoversion_release.yaml
- Replaced AI-based bugfix detection with autoversion action for consistency
- Optimized jq usage (removed unnecessary cat)
- Fixed checkout conflicts by using `path: repo` subdirectory approach

&gt; @copilot of the changes produces invalid yaml syntax. think
hard, find it, and fix

Fixed in 5c75cca - Removed orphaned `echo
"commit_sha=$commit_sha" >> "$GITHUB_OUTPUT"` statement at line
21 that was causing the YAML syntax error. Both workflow files
now validate successfully.
