<request>

You are working on a task in the 'gui-cs/clet' repository.

<repository_context>
I've cloned the repository in the directory /home/runner/work/clet/clet (not in /tmp/inputs). Always use absolute paths when referring to files in the repository.
</repository_context>

<current_datetime>2026-05-04T18:05:07.281+00:00</current_datetime>

Consider the following problem statement:

<problem_statement>
try again
</problem_statement>

First, determine whether the <problem_statement> requires code changes, an explanation, a plan, or analysis. Then follow the appropriate path:

If the task requires code changes:

If the task is a question or only requires creating a plan or analysis: respond directly without making code changes.

<prev_assistant>

The branch is clean and up to date with the remote — there's nothing new to push. The previous push failure was due to the `tig` user not having write access to `gui-cs/clet` (HTTP 403).

If you'd like me to make a change and then push it via `report_progress`, I can do that — but I need an actual task or code change to commit. The "try again" on its own with no pending changes won't produce a different result.

What would you like me to do? If you have a specific task (code change, feature, fix), let me know and I'll implement it and push.
