<prev_assistant>

The fix is complete. Here's a summary:

Root Cause: GoReleaser executes build hooks directly without a shell, so shell-style variable expansion (`$GOOS/$GOARCH`) doesn't work — the literal string `$GOOS/$GOARCH` was passed to the `go tool bundler` command.

Fix: Changed line 25 of `.goreleaser.yaml` from:
```yaml
- go tool bundler --platform $GOOS/$GOARCH
```
to:
```yaml
- go tool bundler --platform {{ .Os }}/{{ .Arch }}
```

GoReleaser's template syntax `{{ .Os }}` and `{{ .Arch }}` are expanded to the target OS and architecture (e.g., `linux/amd64`, `darwin/arm64`) for each build target before the hook command is executed.

Security Summary: No security vulnerabilities were introduced or discovered. The change is a YAML configuration fix only.
