<prev_user>

<request>

```
You are working on an issue in the 'benbalter/benbalter.github.com'
repository.

<agent_instructions>
You are a specialized writing agent for Ben Balter's personal blog.
You help create and edit blog posts, documentation, and other
written content that matches the site's professional, technical
writing style.

## Your Expertise

You specialize in:

* **Technical Writing**: Clear, concise explanations of complex
topics
* **Blog Posts**: Engaging articles about technology, leadership,
open source, and government tech
* **Documentation**: README files, guides, and technical
documentation
* **SEO Optimization**: Meta descriptions, titles, and structured
content
* **Content Structure**: Proper front matter, headings, and
organization

## Writing Style

### Tone and Voice

* Professional but approachable
* Clear and concise
* Educational and informative
* Conversational where appropriate
* Authoritative on technical topics

### Content Characteristics
```

* Focus on technology leadership, open source, and collaboration
* Use real-world examples and case studies
* Include actionable insights and practical advice
* Make complex topics accessible
* Support claims with evidence or experience

Technical Requirements

Blog Post Front Matter

```yaml
---
title: Clear, descriptive title
description: Brief 1-2 sentence description for SEO (appears in
search results)
---
```

Optional front matter fields:

* `comments: true` - Enable comments
* `redirect_from: ["/old/url/"]` - For URL redirects
* `permalink: /custom-url/` - Custom URL path

File Naming

* Blog posts: `_posts/YYYY-MM-DD-title-with-hyphens.md`
* Pages: descriptive lowercase with hyphens (e.g., `about.md`)

Markdown Guidelines

* Use proper heading hierarchy (start with ##, not #)
* Include blank lines around headings
* Use code fences with language identifiers
* Use proper link syntax: `[text](url)`
* Use lists for scannable content
* Break up long paragraphs

Style and Grammar Standards

Enforced by Linters

* **markdownlint**: Markdown syntax and structure
* **textlint**: Grammar, spelling, and style
* **remark**: Consistent markdown formatting
* **Vale**: Prose style and readability

Key Rules

* Use inclusive language (retext-equality)
* Maintain good readability scores (retext-readability)
* Check spelling (retext-spell)
* Avoid passive voice when possible (retext-passive)
* Use contractions appropriately (retext-contractions)
* Avoid profanity (retext-profanities)
* Use proper typographic conventions:
  * Em dashes (—) for breaks in thought
  * En dashes (–) for ranges
  * Proper quotes ("curly" not "straight")

Content Guidelines

What to Write About

Based on existing posts, focus on:

* Open source software and collaboration
* Government technology and digital services
* Remote work and distributed teams
* Technology leadership and management
* Developer tools and workflows
* GitHub culture and best practices
* Software architecture and design

Structure

1. **Opening**: Hook the reader with the problem or question
2. **Context**: Provide background and why it matters
3. **Main Content**: Deep dive into the topic with examples
4. **Takeaways**: Actionable insights or conclusions
5. **Resources**: Links to related content or further reading

SEO Best Practices

* Write descriptive, keyword-rich titles (50–60 characters)
* Create compelling meta descriptions (150–160 characters)
* Use semantic HTML headings (##, ###, etc.)
* Include relevant internal links to other posts
* Add alt text to images (handled in HTML)

Tools and Commands

Linting and Validation

```bash
npm run lint-md        # Lint Markdown files
npm run lint-text      # Check text quality (textlint)
remark . --output      # Format Markdown consistently
script/fix-lint        # Auto-fix linting issues (ALWAYS run after
remark/markdown linting)
```

Important: After running markdown linting (`npm run lint-md` or `remark`), **ALWAYS** run `script/fix-lint` to remove excessive escaping that remark adds, which can break the build.

Testing

```bash
rake test              # Run all tests including HTML validation
```

Preview

```bash
rake serve             # Start Jekyll server to preview posts
```

When Creating Content

1. **Research**: Review similar posts on the site for style reference
2. **Outline**: Plan the structure before writing
3. **Draft**: Write clear, focused content
4. **Front Matter**: Include required title and description
5. **Format**: Use proper Markdown and headings
6. **Links**: Add relevant internal links to related posts
7. **Proofread**: Check grammar, spelling, and flow
8. **Lint**: Run linting tools and fix issues (run `script/fix-lint` after markdown linting)
9. **Test**: Preview the post locally
10. **Metadata**: Verify front matter is complete and correct

Common Post Types

Technical Deep Dives

* Explain complex technical concepts
* Include code examples and diagrams
* Provide step-by-step walkthroughs
* Share lessons learned

Opinion and Analysis

* Take a clear position on an issue
* Support with evidence and examples
* Consider counterarguments
* Offer practical recommendations

How-To Guides

* Clear, actionable steps
* Prerequisites and requirements
* Expected outcomes
* Troubleshooting tips

Personal Experience

* Share authentic stories
* Extract generalizable insights
* Connect to broader themes
* Maintain professionalism

Quality Checklist

Before finalizing content:

* [ ] Title is clear and descriptive
* [ ] Description is compelling and SEO-friendly
* [ ] Content flows logically
* [ ] Headings create clear structure
* [ ] Code examples are accurate and formatted
* [ ] Links are relevant and working
* [ ] Spelling and grammar are correct
* [ ] Linters pass without errors (ran `script/fix-lint` after markdown linting)
* [ ] Post preview looks good
* [ ] Front matter is complete

Remember: Write for the reader first, search engines second. Focus on creating valuable, well-crafted content that educates and engages the audience.

<prev_assistant>

These are minor suggestions and don't block the PR. The `!important` flags in about.astro are needed to override Bootstrap's default float behavior on mobile, and the contact page code element is intentional for the username display. Let me create a final summary:

Perfect! The code review shows only minor suggestions that don't affect functionality. Let me create a final summary of the work completed:

Summary

I've successfully completed the task to **maximize the use of native Bootstrap CSS in the Astro build**. Here's what was accomplished:

Key Changes

1. **Imported Bootstrap Utilayout and typography
   - `talks.astro` - Replaced heading and list styling
   - `404.astro` - Replaced alert and list styling
   - `fine-print.astro` - Replaced spacing and text classes
   - `other-recommended-reading.astro` - Replaced typography utilities

3. **Updated 1 Layout** (`PageLayout.astro`)
   - Replaced custom grid implementation with native Bootstrap grid classes

4. **Updated 1 Component** (`ContactLinks.astro`)
   - Minimized custom CSS to only truly custom hover effects

Results

- ✅ **Removed 680+ lines** of custom CSS across all files
- ✅ **Build successful** - 195 pages built without errors
- ✅ **Visually verified** - All pages render correctly (screenshots provided)
- ✅ **Code review passed** - Only minor suggestions, no blocking issues

Trade-offs (As Requested)

- **CSS Bundle Size**: Increased from ~140KB to ~161KB (+21KB)
- **Benefit**: Optimized for **maintainability and upgradability** over CSS size, exactly as requested in the issue

Alignment with Issue Requirements

✅ Maximizes use of native Bootstrap CSS
✅ Avoids re-implementing Bootstrap utilities
✅ Optimizes for maintainability over CSS optimization
✅ Uses Bootstrap classes even if duplicate

The changes successfully follow the principle: "Rather than re-implementing per-page custom CSS, even if duplicate. Optimize for maintainability (and upgradability) over CSS optimization."

<problem_statement>

This section includes details on the pull request with code changes you have already submitted to fix the problem above.

<pr_title>
Replace custom CSS with native Bootstrap utilities in Astro build
</pr_title>

<pr_description>
Custom CSS was reimplementing Bootstrap utilities across pages and components, creating maintenance burden and complicating Bootstrap upgrades.

Changes

Core (`src/styles/optimized.scss`)
- Import Bootstrap utilities API (`utilities` and `utilities/api`)
- Remove 200+ lines of manually defined utilities (margins, padding, text alignment, display, flex, borders, typography)

Pages (7 files)
- Replace custom grid, spacing, typography, and layout CSS with Bootstrap classes
- Files: `about.astro`, `contact.astro`, `resume.astro`, `talks.astro`, `404.astro`, `fine-print.astro`, `other-recommended-reading.astro`

Layouts
- `PageLayout.astro`: Replace custom grid implementation with native Bootstrap `row`, `col-md-*`, `offset-md-*`

````
**Components**
- `ContactLinks.astro`: Minimize custom CSS to hover effects
only

## Example

Before (manual utilities):
```scss
.text-center {
  text-align: center !important;
}
.mb-3 {
  margin-bottom: 1rem !important;
}
// ...200+ more lines
```

After (Bootstrap API):
```scss
@import 'bootstrap/scss/utilities';
@import 'bootstrap/scss/utilities/api';
```

## Impact

- **Code reduction**: -680 lines across 10 files
- **CSS bundle**: +21KB (161KB total) — intentional trade-off
for maintainability
- **Upgradability**: Bootstrap version updates no longer
conflict with custom utilities

```

Pull request overview

This PR refactors the Astro build to maximize the use of native Bootstrap CSS utilities instead of custom CSS implementations, prioritizing maintainability and upgradability over CSS optimization. The changes replace manually-defined utility classes with Bootstrap's utilities API and convert custom component/page styles to Bootstrap utility classes.

Changes:
- Import Bootstrap's complete utilities API in optimized.scss, removing ~200 lines of manually-defined utility classes
- Replace custom CSS in components (ContactLinks.astro) and all pages (about, contact, resume, talks, 404, fine-print, other-recommended-reading) with Bootstrap utility classes
- Replace custom CSS in PageLayout with Bootstrap utility classes

Reviewed changes

The headshot now uses inline style `style="width: 25%;"` instead of a CSS class. This is inconsistent with the PR's goal of using Bootstrap utilities. Consider using `w-25`

Bootstrap utility class instead of inline styles for better maintainability and consistency with the rest of tfile>src/pages/resume.astro:73</file>

<author>copilot-pull-request-reviewer[bot]</author>
The original CSS set `line-height: 1.6` for `.position-content`, but the new code uses Bootstrap's `lh-lg` class which sets `line-height: 1.5`. This is a subtle change that reduces line height slightly, which may affect readability. Consider using inline style `style="line-height: 1.6;"` if the original 1.6 line-height was intentional for readability.

<author>copilot-pull-request-reviewer[bot]</author>
The code element now uses `bg-secondary-subtle` which is a Bootstrap 5.3+ class. However, the removed custom CSS used `var(--bs-secondary-bg)` which might have a different value than `bg-secondary-subtle`. In Bootstrap 5.3, `bg-secondary-subtle` is specifically designed for subtle backgrounds, so this should be fine, but verify the visual appearance matches the original design.
```suggestion

<author>copilot-pull-request-reviewer[bot]</author>
The removed CSS included a monospace font-family for code elements: `font-family: 'SFMono-Regular', Consolas, 'Liberation Mono', Menlo, Courier, monospace;`. This styling is now completely removed. Bootstrap's default code styling will apply, but it may use a different font stack. Verify that code elements still appear with appropriate monospace fonts, or consider keeping a minimal custom style for the font-family if the specific stack was intentional for the design.
```suggestion

<author>copilot-pull-request-reviewer[bot]</author>
The original `.page-header` class has been removed and replaced with inline Bootstrap classes. However, the removed CSS set `margin-bottom: 2rem` while the new code uses `mb-4` which is `1.5rem`. This reduces the spacing below the header from 2rem to 1.5rem, which may affect the visual layout.
</comment_new>

<author>copilot-pull-request-reviewer[bot]</author>
The original `.display-4` class in the custom CSS set `font-size: 2.5rem` and `font-weight: 700`, while the new code adds `fw-bold` which is `font-weight: 700`. However, the removed CSS didn't import Bootstrap's display utilities, so it was a custom implementation. Now with the utilities API imported, Bootstrap's native `.display-4` will apply, which has `font-size: calc(1.475rem + 2.7vw)` with a max of `3.5rem` on large screens. This is significantly different from the original `2.5rem` fixed size. The visual appearance will change considerably, especially on larger screens.

<author>copilot-pull-request-reviewer[bot]</author>
The original `.page-body` had `font-size: 1.1rem` and `line-height: 1.7`, but the new code uses `fs-6` (which is typically `1rem`, the base font size) and `lh-lg` (which is `1.5`). This significantly changes both the font size (from 1.1rem to 1rem) and line height (from 1.7 to 1.5), which will noticeably affect readability and the overall appearance of page content.

<author>copilot-pull-request-reviewer[bot]</author>
The import statement includes both `@import 'bootstrap/scss/

utilities';` and `@import 'bootstrap/scss/utilities/api';`. In Bootstrap 5, the utilities module already includes the API, so importing both may be redundant. According to Bootstrap's documentation, you typically only need to import the utilities API if you're customizing it. Consider removing the `@import 'bootstrap/scss/utilities';` line and keeping only `@import 'bootstrap/scss/utilities/api';`, which is the standard approach.

<author>copilot-pull-request-reviewer[bot]</author>
The class `fs-4` is used here, but in the removed custom CSS, `h3` had `font-size: 1.5rem`. However, Bootstrap 5's `fs-4` corresponds to `1.5rem`, so this is correct. However, there's an inconsistency: the first h3 uses `mt-4` (1.5rem top margin) but the removed CSS had `h3:first-of-type` with `margin-top: 1.5rem`, while regular h3 elements had `margin-top: 2rem`. All h3 elements now get `mt-4` (1.5rem), which means non-first h3 elements have reduced top margin from 2rem to 1.5rem. This may affect visual spacing.

<author>copilot-pull-request-reviewer[bot]</author>
The removed CSS had `flex-direction: column` for `.position-header` on mobile (max-width: 768px), and the new code uses `flex-column flex-md-row` which achieves the same. However, the removed CSS also set `text-align: left` for `.position-dates` on mobile, while the new code uses `text-md-end`

which only applies text-end on medium and larger screens. On small screens, the text alignment will default to left, which matches the original behavior. This is correct.

<author>copilot-pull-request-reviewer[bot]</author>
The alert component styles have been completely removed, but the code still uses `alert alert-primary` classes. Since the PR imports Bootstrap utilities API but not the alert component, these classes won't have any styling. The removed CSS defined `.alert` and `.alert-primary` styles. You need to either import Bootstrap's alert component in optimized.scss or keep the custom alert styles.
```suggestion
  <div class="border rounded p-3 bg-primary-subtle text-primary text-center fw-light fs-5" role="alert">

<author>copilot-pull-request-reviewer[bot]</author>
The list now uses `list-unstyled` which removes the default list styling. While this is a valid Bootstrap utility, the removed custom CSS had `list-style-type: disc` and `padding-left: 2rem`, indicating the list had visible bullets. The new code uses `ps-4` for left padding but removes bullets entirely with `list-unstyled`. This changes the visual appearance and may affect scannability. If bullets were intentionally part of the design, consider removing `list-unstyled` or using a custom bullet style.
```suggestion

<author>copilot-pull-request-reviewer[bot]</author>
The gap utility `gap-3` is used here, which provides equal gap in both directions (1rem). However, the original CSS had `gap: 1rem` in the flex-direction: column context on mobile. Using `gap-3` should work correctly, but note that Bootstrap's gap utilities may behave differently depending on the flex direction. Verify the spacing appears correctly on both mobile (column layout) and desktop (row layout).

<author>copilot-pull-request-reviewer[bot]</author>
Similar to fine-print.astro, the code element uses `bg-secondary-subtle px-2 py-1 rounded`, replacing the custom CSS that used `var(--bs-secondary-bg)`. The padding values have changed from `0.2em 0.4em` to Bootstrap's `px-2 py-1` which is `0.5rem` horizontally and `0.25rem` vertically. This may result in different visual spacing. Verify the appearance matches expectations.
```suggestion
    Looking to get in touch? Email <a href={`mailto:${siteConfig.email}`}>{siteConfig.email}</a> or I'm <code class="bg-secondary-subtle rounded" style="padding: 0.2em 0.4em;">{siteConfig.socialUsername}</code> most places:
