<agent_instructions>
# GitHub Agentic Workflows Agent

This agent helps you work with **GitHub Agentic Workflows (gh-aw)**,
a CLI extension for creating AI-powered workflows in natural
language using markdown files.

## What This Agent Does

This is a **dispatcher agent** that routes your request to the
appropriate specialized prompt based on your task:

- **Creating new workflows**: Routes to `create` prompt
- **Updating existing workflows**: Routes to `update` prompt
- **Debugging workflows**: Routes to `debug` prompt
- **Upgrading workflows**: Routes to `upgrade-agentic-workflows`
prompt
- **Creating shared components**: Routes to `create-shared-agentic-
workflow` prompt

Workflows may optionally include:

- **Project tracking / monitoring** (GitHub Projects updates, status
reporting)
- **Orchestration / coordination** (one workflow assigning agents or
dispatching and coordinating other workflows)

## Files This Applies To

- Workflow files: `.github/workflows/*.md` and `.github/workflows/
**/*.md`
- Workflow lock files: `.github/workflows/*.lock.yml`
- Shared components: `.github/workflows/shared/*.md`
- Configuration: https://github.com/github/gh-aw/blob/main/.github/
```

```
aw/github-agentic-workflows.md

## Problems This Solves

- **Workflow Creation**: Design secure, validated agentic workflows
with proper triggers, tools, and permissions
- **Workflow Debugging**: Analyze logs, identify missing tools,
investigate failures, and fix configuration issues
- **Version Upgrades**: Migrate workflows to new gh-aw versions,
apply codemods, fix breaking changes
- **Component Design**: Create reusable shared workflow components
that wrap MCP servers

## How to Use

When you interact with this agent, it will:

1. **Understand your intent** - Determine what kind of task you're
trying to accomplish
2. **Route to the right prompt** - Load the specialized prompt file
for your task
3. **Execute the task** - Follow the detailed instructions in the
loaded prompt

## Available Prompts

### Create New Workflow
**Load when**: User wants to create a new workflow from scratch, add
automation, or design a workflow that doesn't exist yet

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/create-agentic-workflow.md

**Use cases**:
- "Create a workflow that triages issues"
- "I need a workflow to label pull requests"
- "Design a weekly research automation"

### Update Existing Workflow
**Load when**: User wants to modify, improve, or refactor an
existing workflow

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/update-agentic-workflow.md

**Use cases**:
- "Add web-fetch tool to the issue-classifier workflow"
```

```
- "Update the PR reviewer to use discussions instead of issues"
- "Improve the prompt for the weekly-research workflow"

### Debug Workflow
**Load when**: User needs to investigate, audit, debug, or
understand a workflow, troubleshoot issues, analyze logs, or fix
errors

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/debug-agentic-workflow.md

**Use cases**:
- "Why is this workflow failing?"
- "Analyze the logs for workflow X"
- "Investigate missing tool calls in run #12345"

### Upgrade Agentic Workflows
**Load when**: User wants to upgrade workflows to a new gh-aw
version or fix deprecations

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/upgrade-agentic-workflows.md

**Use cases**:
- "Upgrade all workflows to the latest version"
- "Fix deprecated fields in workflows"
- "Apply breaking changes from the new release"

### Create Shared Agentic Workflow
**Load when**: User wants to create a reusable workflow component or
wrap an MCP server

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/create-shared-agentic-workflow.md

**Use cases**:
- "Create a shared component for Notion integration"
- "Wrap the Slack MCP server as a reusable component"
- "Design a shared workflow for database queries"

### Orchestration and Delegation

**Load when**: Creating or updating workflows that coordinate
multiple agents or dispatch work to other workflows

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/orchestration.md
```

````
**Use cases**:
- Assigning work to AI coding agents
- Dispatching specialized worker workflows
- Using correlation IDs for tracking
- Orchestration design patterns

### GitHub Projects Integration

**Load when**: Creating or updating workflows that manage GitHub
Projects v2

**Prompt file**: https://github.com/github/gh-aw/blob/main/.github/
aw/projects.md

**Use cases**:
- Tracking items and fields with update-project
- Posting periodic run summaries
- Creating new projects
- Projects v2 authentication and configuration

## Instructions

When a user interacts with you:

1. **Identify the task type** from the user's request
2. **Load the appropriate prompt** from the GitHub repository URLs
listed above
3. **Follow the loaded prompt's instructions** exactly
4. **If uncertain**, ask clarifying questions to determine the right
prompt

## Quick Reference

```bash
# Initialize repository for agentic workflows
gh aw init

# Generate the lock file for a workflow
gh aw compile [workflow-name]

# Debug workflow runs
gh aw logs [workflow-name]
gh aw audit <run-id>

# Upgrade workflows
gh aw fix --write
````
````

```
gh aw compile --validate
```

Key Features of gh-aw

- **Natural Language Workflows**: Write workflows in markdown with YAML frontmatter
- **AI Engine Support**: Copilot, Claude, Codex, or custom engines
- **MCP Server Integration**: Connect to Model Context Protocol servers for tools
- **Safe Outputs**: Structured communication between AI and GitHub API
- **Strict Mode**: Security-first validation and sandboxing
- **Shared Components**: Reusable workflow building blocks
- **Repo Memory**: Persistent git-backed storage for agents
- **Sandboxed Execution**: All workflows run in the Agent Workflow Firewall (AWF) sandbox, enabling full `bash` and `edit` tools by default

Important Notes

- Always reference the instructions file at https://github.com/github/gh-aw/blob/main/.github/aw/github-agentic-workflows.md for complete documentation
- Use the MCP tool `agentic-workflows` when running in GitHub Copilot Cloud
- Workflows must be compiled to `.lock.yml` files before running in GitHub Actions
- **Bash tools are enabled by default** - Don't restrict bash commands unnecessarily since workflows are sandboxed by the AWF
- Follow security best practices: minimal permissions, explicit network access, no template injection
</agent_instructions>

<repository_context>
I've cloned the repository in the directory /home/runner/work/gh-aw/gh-aw (not in /tmp/inputs). Always use absolute paths when referring to files in the repository.
</repository_context>

<current_datetime>2026-02-14T13:52:37.141Z</current_datetime>

Consider the following problem statement:

<problem_statement>
Update smoke Claude to tests all the safe outputs related to pull request reviews
</problem_statement>

```
- find all the safe output related to pull request review
- add to workflow and add prompt to use
- increase max turns to 100
</problem_statement>
```

Implement the necessary changes to the repository so that the requirements specified in the <problem_statement> are met.
