<request>

You are working on an issue in the 'anchorageoss/visualsign-parser' repository.

<repository_context>
I've cloned the repository in the directory /home/runner/work/visualsign-parser/visualsign-parser (not in /tmp/inputs). Always use absolute paths when referring to files in the repository.
</repository_context>

<current_datetime>2026-07-03T15:46:23.521+00:00</current_datetime>

Consider the following problem statement:

<problem_statement>

This section details on the original issue you should resolve

<issue_title>(bug)TVC deployment QoS version not supported</issue_title>
<issue_description>### Project version

v0.791.0

What happened?

When deploying to TVC, the QoS version supported has changed from what is included in release notes.

Minimal reproduction steps

```
a@penguin:~/tvc$ tvc deploy create tvc-deploy.json
Creating deployment for app 'REDACTED'...
Error: failed to create TVC deployment

Caused by:
```

```
        HTTP response was not successful: 400 ({"code":3,
    "message":"QOS version \"v2026.2.6\" is no longer supported for
    new deployments (supported releases: v2026.6.11)", "details":[],
    "turnkeyErrorCode":""})
    </issue_description>
    - Closes anchorageoss/visualsign-parser#407

    ## Comments on the Issue (you are @copilot in this section)

    <comments>
    <comment_new><author>@shahan-khatchadourian-anchorage</author>
    update default qos value to v2026.6.11</comment_new>
    </comments>
    </problem_statement>

  Implement the necessary changes to the repository so that the
  requirements specified in the <problem_statement> are met.
```

<prev_assistant>

All checks pass. Here's a summary of what was done:

Changes Made

Bumped the default QoS version from `v2026.2.6` to `v2026.6.11` in all 5 locations where it was hardcoded:

File	Change
`.github/workflows/tvc-deploy.yml`	Updated `workflow_dispatch` input default and the `QOS_VERSION` env fallback
`.github/workflows/stagex.yml`	Updated the hardcoded `qos_version` variable in the deployment details step
`tools/tvc-deploy/src/main.rs`	Updated both the usage string and the `unwrap_or` default in `deploy()`
`src/Cargo.toml`	Updated the TVC version comment and `# qos-deployment-rev` marker to the corresponding qos commit (`3e4d73c4d2b9bb270c457bf7eae2e76a7f420998`)
`docs/wallet-integration/hosted/getting-started.mdx`	Updated the TVC version string and qos commit link used for PCR allowlist derivation

> **Note on the qos deployment rev**: The new qos commit `3e4d73c4d2b9bb270c457bf7eae2e76a7f420998` is the most recent main-branch merge in `tkhq/qos` from the period corresponding to TVC v2026.6.11 (CI run [27232527879](https://github.com/tkhq/qos/actions/runs/27232527879)). If Turnkey uses a different internal qos commit for

this TVC release, the `qos-deployment-rev` marker in `src/Cargo.toml` and the matching line in the docs should be corrected accordingly — the `scripts/extract-nitro-pcrs.sh --rev <sha>` flag can be used to audit any candidate commit before updating the marker.

<request>

You are working on a task in the 'anchorageoss/visualsign-parser' repository.

<repository_context>
I've cloned the repository in the directory /home/runner/work/visualsign-parser/visualsign-parser (not in /tmp/inputs). Always use absolute paths when referring to files in the repository.
</repository_context>

<current_datetime>2026-07-03T16:38:53.609+00:00</current_datetime>

Consider the following problem statement:

<problem_statement>
tell me how the qos commit was obtained for the qos version v2026.6.11?
</problem_statement>

First, determine whether the <problem_statement> requires code changes, an explanation, a plan, or analysis. Then follow the appropriate path:

If the task requires code changes:

If the task is a question or only requires creating a plan or analysis: respond directly without making code changes.
